## ASSAY / ANALYTICAL PROCEDURE ALKALINE PHOSPHATASE

## 1. METHOD OF ASSAY:

Based on that of Bessey et al in which the rate of formation of the yellow colour of $p$ nitrophenol ( $p-N P$ ) produced by hydrolysis of p-nitrophenylphosphate ( $p-N P P$ ) in alkaline solution is measured spectrophotometrically at 405 nm and $37^{\circ} \mathrm{C}$.

## 2. UNIT DEFINITION:

That amount of enzyme which catalyses the liberation of 1 micromole p-nitrophenol per minute at $37^{\circ} \mathrm{C}$.
3. REAGENTS:
3.1
3.2
$\begin{array}{ll}10,25 \text {. Adjust with } 1 \mathrm{M} \mathrm{NaOH} \text { or } 5 \mathrm{M} \mathrm{HCl} \text {. St } \\ 3.2 & \text { Substrate [ } \mathbf{0 , 4 \mathrm { M }} \text { p-Nitrophenyl Phosphate] }\end{array}$
Dissolve 105mg Na $\mathrm{Na}_{2}$ p-NPP [MM 263,05] or 148,46 mg Na 2 p-NPP. $6 \mathrm{H}_{2} \mathrm{O}$ [MM 371,15] / ml distilled $\mathrm{H}_{2} \mathrm{O}$. Store on ice.

## $3.3 \quad$ Sample

For F/D product, dissolve 1 mg enzyme/ml ice-cold buffer [3A]. Immediately before assay, dilute to yield $\pm 0,15 \mathrm{u} / \mathrm{ml}$ ice-cold buffer. $[\Delta \mathrm{A} / \mathrm{min} 0,09-0,12]$.
4. PROCEDURE:
$\lambda: 405 \mathrm{~nm}$; Temp.: $37^{\circ} \mathrm{C}$; cuvette volume: $3,0 \mathrm{ml}$; Light Path: 10 mm
Into a 10 mm quartz cell, pipette:
Buffer [3.1] $\quad 2,8 \mathrm{ml}$
Substrate [3.2] $\quad 0,1 \mathrm{ml}$
Equilibrate at $37^{\circ} \mathrm{C}$ and monitor $\Delta \mathrm{A} / \mathrm{min}$.
Enzyme [3.3]

$$
\begin{aligned}
& 0,1 \mathrm{ml} \\
& \hline 3,0 \mathrm{ml} \\
& \hline
\end{aligned}
$$

Record rate of increase in absorbance at 405 nm for $\pm 5$ minutes.
5. CALCULATION:

$$
\text { ACTIVITY }[\mathrm{u} / \mathrm{mg}]=\frac{\Delta \mathrm{A}_{405 / \mathrm{min}} \times 3 \times \text { dilution }}{18,8 \times 0,1 \times \mathrm{mg} \text { enzyme } / \mathrm{ml} \text { original solution }}
$$

[ $\varepsilon=18,8 ; 3,0=$ cuvette volume; $0,1=$ enzyme volume]
